```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall and HindIII sites of the pDNN-DUNL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATG' to provide Kozak consensus sequence; 'GG' after last codon and before HindIII site to maintain reading frame. Clone distribution: http://bioinfo.clontech.com/orfclones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 (bases 1 to 1146)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      841 AAATTCCTCATTGTTATTGTGGAAAGACAGGCTGCCAGGCTCATTCAAGAGAGCCCCACC
                                                                                                                                                                                                                                                  Circle, Palo Alto, CA 94303, USA
This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloning system between the Sall and HindIII sites of the pDNR-DWAL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATG' to provide Kozak consensus sequence; 'GG' after last codon and before HindIII site to maintain reading frame. Clone distribution: http://bboinfo.clontech.com/orfclones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                artificial sequences.

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.
                                                                                                                                                                                                                                                                                                   of Molecular and Human Genetics, Baylor College of Medici

ANNOTATION OF FEATURES:
```

STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annotation.ht

The present invention describes an isolated polypeptide (A) comprising an amino acid sequence selected from one of 55 amino acid sequences 42-876 residues in length, corresponding to FLEXHT-1 to FLEXHT-55, a 90 % identical sequence, and a biologically active or immunogenic fragment of the sequence. The FLEXHT proteins can have antianaemic, anticonvulsant,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14-MAY-1999;

The present sequence encodes a human protein with hydrophobic domains. CC AAF75159 represents a shorter version of the present sequence. The CC protein possesses a hydrophobic domain and so is a secretory protein CC or a membrane protein. The protein is used as an antigen to prepare CC antibodies. The polynucleotide sequence is useful as a source of probes (for genetic diagnosis. It is also useful for producing the protein in large quantities and for gene therapy. The eukaryotic cells are used for detecting the receptors or ligands corresponding to the protein and CC for detecting small novel pharmaceuticals. The antibodies are also used for detection, quantification and purification of the proteins. Both the CC protein and polynucleotide may be used in research or as nutritional CC sources or supplements. The protein may have cytokine and cell CC sources or supplements. The protein may have cytokine and cell CC proliferation/differentiation activity, immune stimulating or suppressing CC activity, hemotopoiesis regulating activity, tissue growth activity, activity, hemostatic cand thrombolytic activity, receptor/ligand activity, anti-inflammatory CC and thrombolytic activity, receptor/ligand activity, anti-inflammatory CC infectious diseases, cancer, sepsis, anaemias, burns and ulcers, CC immune deficiencies resulting from autoimmune disorders or complete response and enhance cognilation or inhibit to thrombosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 4; Page 120-124; 151pp; English.

Detecting granulocyte activation by detecting differential export of genes associated with granulocyte activation, which serves diagnostic markers that is useful for monitoring disease state states and expression

Claim 1; SEQ ID No 991; 114pp; English

CC (GCA), by detecting the level of expression of gene(s) (GS) activation (CC (GCA), by detecting the level of expression of gene(s) (GS) identified by CC (DNA chip analysis as given in the specification, and comparing CC (CDNA chip analysis as given in the specification, and comparing CC (CDNA chip analysis as given in the specification and comparing CC (CDNA chip included are modulating (MS) GA by contacting GC with an agent CC (Also included are modulating (MS) GA by contacting GC with an agent CC (CDNA) in a tissue, an allergic response in a subject, exposure of a CC (CDNA) in a tissue, an allergic response in a subject, exposure of a CC (CDNA) in a tissue, an allergic response in a subject, exposure of a CC (CDNA) in a tissue, an allergic response in a subject, exposure of a CC (CDNA) in a tissue, an allergic response in a subject, exposure of a CC (CDNA) in a tissue, an allergic response in a subject, exposure of a CC (A) treating (MS) an inflammation (especially the CC (A) treating (MS) an inflammation (especially CDNA) in a tissue, an allergic response in a subject to a pathogen or sterile inflammatory disease, by detecting the CC (A) treating (MS) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen (CC (A) treating (MS) an inflammation (especially chronic) or in a tissue, an allergic response in a subject to a pathogen or sterile inflammatory disease, by contacting an agent capable of modulating (COA), MS is useful for screening an agent capable of modulating (COA), MS is useful for screening an agent capable of modulating (COA), MS is useful for screening an agent capable of modulating (COA), MS is useful for screening an agent capable of modulating (COA), MS is useful for screening an agent capable of modulating (COA), MS is useful for screening an agent capable of modulating (COA), MS is useful for screening an agent capable of modulating (COA), MS is useful for a pathogen or sterile (COA), MS is useful for screening the pathoge ftp.wipo:int/pub/published\_pct\_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug toxicity, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a painvolves detecting the level of expression of two or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 1842

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical cagent to be tested for anti-neoplastic activity, determining a change in cexpression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL6164 comprises a sequence (S) selected from 8447 sequences (given in ABL6164 comprises a sequence (S) selected from 8447 sequences (given in ABL6164 comprises a sequence of anti-neoplastic activity. (I) has cytostatic cativity and can be used in gene therapy. M1 can be used for screening can anti-neoplastic agent, and can be used for producting a product which can the data collected with respect to the anti-neoplastic agent as a correct such as colon, breast to convey the chemical cativity and the data is sufficient to convey the chemical consphageal, ovarian, kidney, prostate or pancreatic cancer, cadenocarcinoma, carcinoma, clear cell cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving
